

Keepnet live UI review

For the product owner and implementation agent | <https://keepnet.pages.dev/>

A coherent visual prototype that still needs an interaction pass before real-world use

The calm palette, fishing photography and journal structure already work together. The biggest next gains are faster session setup, reliable keyboard behavior, clearer catch management and an honest boundary between the demo and a signed-in journal. Keep the overall aesthetic; spend the next iteration on those fundamentals.

Live desktop screenshot. The interface is a 480 px column inside a 1165 px viewport. This is not a mobile-device screenshot.

Fix these five things first

P1 Make starting a session fast

Reduce optional-photo prominence, remove nested scrolling, keep the action visible

P1 Fix dialog focus and keyboard dismissal

Tab currently reaches background content; Escape does not close the sheet

P1 Make catch management predictable

Provide a visible edit path and align View all with the content it promises

P1 Make the demo boundary explicit

Seeded data and Reset demo data appear without an obvious demo notice

P2 Refine hierarchy and finish the brand

Bring the useful action up, apply the approved wordmark, and validate responsive layouts

Faster session setup

The first task should be easy while standing beside the water

Authentic screenshot crop of the session sheet, including its two scroll areas. No session was created.

What the live sheet does

The optional location photo occupies a large block before the venue choices. The sheet and the venue list both scroll. At the inspected 757 px viewport height, the final Start session action is below the visible fold.

This puts presentation ahead of the mandatory decision. It also makes a short form feel longer than it needs to be.

Keep the good parts

The selected venue has a clear outline, venue rows are generous at 62 px high, the main button is 52 px high, and sharing starts switched off.

1 Put the venue and action first

Observed Start a session offers GPS or five listed venues. No manual location search/name field, fishing-type selector or target selector was visible in this sheet.

Change Use a compact venue control first, with search/manual entry and a GPS option. Follow with fishing type and targets when needed. Make the photo a small optional action. Use one scrollable body and a persistent bottom Start session button. Keep the private default beside that action.

Done when At 360 x 800 and 390 x 844, venue choice and Start session are easy to reach without nested scrolling. A user can start without adding media or granting location permission.

Impact Less thumb travel, less uncertainty, and a better path when GPS is denied or the venue is not in the preset list. GPS-denial behavior and small-screen keyboards were not exercised in this review.

Reliable everyday controls

Verified keyboard defects and concrete navigation improvements

2 Treat the session sheet as a real modal

Observed Opening the sheet leaves focus on the background New session button. One Tab moves to a background session card. Escape leaves the sheet open. A dialog role exists, but aria-modal was absent in the inspected DOM.

Change Move focus inside on open, make background content inert, contain the Tab sequence, support Escape, and return focus to the opener on close. Give the dialog a programmatic name. Use a proven accessible dialog primitive.

Done when Keyboard-only users can open, traverse and close the sheet without reaching background controls; Shift+Tab wraps; Escape closes; focus returns to New session. Verify with a screen reader as well.

Increase small hit areas

Measured boxes: header Profile 36 x 36 px; New session 40 x 40 px; Close 36 x 36 px; navigation links 31-47 px wide by 42 px high; the privacy switch 44 x 24 px. Use a minimum 44 x 44 px hit area as a product target, with 48 px preferred for bankside use. Make each bottom-navigation item occupy its full equal-width slot. Do not equate these measurements with a full accessibility conformance audit.

3 Make catch management predictable

Observed The inspected catch page presents Share, a visibility pill and Delete catch, but no visible Edit catch action. Home places View all beside Recent catches, yet the link opens the Sessions list.

Change Add a clear Edit catch entry for correcting weight, bait, notes and media. Link Recent catches to a catch history, or rename the current link View sessions. Keep destructive actions visually secondary.

Done when A saved catch can be corrected without deletion. The destination of every View all link matches the nearby heading. Users can get from a catch back to its session.

Catch-detail crop from the live page. Adding or editing a catch was not tested because the read-only review did not create an active session.

Trust and product clarity

Separate what the UI demonstrates from what still needs verification

4 Make the demo and account state explicit

Observed The site opens directly into two sample sessions and two catches. Profile shows Angler and Reset demo data. No Google sign-in or account-state control appeared in the inspected routes.

Change Add an unobtrusive Demo mode indicator and a clear route to the real sign-in flow. Clearly separate sample content from the user's journal. If this deployment is intentionally only a prototype, say so before a person relies on it for personal records.

Done when A new visitor can tell whether entries are examples, whether they are signed in, and what persists. Verify account isolation and persistence separately before removing the demo label.

Live Discover screenshot crop. Google Maps rendered during the review; location permission was not requested.

Clarify the Discover map

The map loads and offers named venue markers, zoom controls and venue details. Selecting River Lune changes the panel and shows a useful no-catches state. The private sample catch was absent from that venue's public catch list.

However, the banner says only shared sessions and catches appear on the map while venues with zero shared catches still have markers. Label this as a venue map with public catch counts; add a small legend. Keep venue pins distinct from any future catch-location pins.

Acceptance The map legend explains each marker. The empty state never suggests that an unshared catch must be made public. Sharing explains the audience, which fields are exposed, and whether location is exact or approximate.

Important A visible Private badge or filtered demo list is not proof of server-side privacy. Sharing toggles, access control and location redaction were not tested.

What is worth preserving

Keep the green primary action, warm off-white background, photography, clear species and weight hierarchy, session-to-catch links, and explicit Private/Shared labels. The public venue empty state is more helpful than a blank panel. These are a sound base for the next iteration.

Finish with focused validation

A short implementation queue rather than a wholesale redesign

5 Bring function forward and complete the brand

Observed On Home, the heading and hero image push Start session to about 506 px from the top. Desktop retains a 480 px column. The live logo uses a separate fish icon and serif wordmark; the latest agreed direction is a rounded green/copper wordmark with the hook from the final t.

Change For returning users, lead with current/next session and its action; shorten or remove the decorative hero. Apply the approved logo asset rather than inventing a new mark. Retain the single column on phones, then use a restrained wider layout on desktop where it improves session/catch scanning.

Done when On a real small phone, the main task is visible immediately. An active session exposes Log catch clearly. The approved logo is legible at header size. At 1024 px and above, space is used intentionally without stretching text excessively.

Secondary polish

Replace the browser title keepnet-app with Keepnet and a meaningful page title. Consider a clearer empty-profile avatar. Reduce the large weather card on catch detail to key conditions with an expandable full view, so the catch and its actions stay prominent. Add a visible text label to the Sessions plus button where space permits.

Required before calling the next build ready

Real mobile views Test 360, 390 and 430 px widths, landscape, enlarged text and the software keyboard. This review did not emulate a mobile viewport; its screenshots are desktop captures and labeled crops.

Catch entry Check quick photo capture, optional weight/bait/notes, unit switching, draft recovery, short video handling and visible save success. Keep Log catch reachable during an active session.

Interrupted conditions Test no GPS, slow/no network, denied camera access, failed media upload, map/weather failures, empty journals and retry without duplicate records.

Privacy and persistence Test Google sign-in, logout, reload, second-device sync, separate accounts, private-by-default saves, catch-versus-session sharing, public fields and exact-location exposure.

Accessibility Recheck focus visibility, keyboard order, modal semantics, live save/error announcements, contrast for all states, text scaling and full-size touch targets.

Review scope

Visited Home, Sessions, a session, a catch, Discover and Profile; opened and closed session setup; tested keyboard behavior and read selected rendered styles. No record was created, edited, deleted, reset or shared. No backend, authentication, security or performance audit was performed. Screenshots show the live build on 3 October 2026 and may differ after deployment changes.
